

Edwards refreshes BIM object repository

February, 2018

We have recently updated our portfolio of BIM Objects for your immediate use. A BIM object is a repository of information that holds data regarding a 2D and/or 3D geometry description of the actual product or component. The information container also holds information such as EAN-codes, U-values, sizes and branding like logo and family names. Links to maintenance documents, assembly manuals etc. are also available in the object. To access the updated repository:
